

Years of value on the lees. One estate to watch over.

Read from your own public record — not inside knowledge. Madeba holds three kinds of value far apart on one estate: Cap Classique ageing in the cellar for up to five years, vineyards on a strict water budget, and a reserve that carries your sustainability story. The gap is **knowing, at any hour, that each is as it should be.**

What we see in **your operation**

WHERE	WHAT HAPPENS TODAY	WHAT IT COSTS
Cellars and lees ageing	Multi-vintage bottled stock waits years before release. Can temperature, power and access be seen remotely, overnight and at weekends?	Stock value at risk per excursion — to confirm
Vineyards and water	Irrigation capped at about 6,000 m ³ /ha a year, with about 3 million litres a month of recycled water. Proof depends on meters reporting from the field	Pump trips, late faults, evidence effort — to confirm
The reserve (~1,900 ha)	Biomass cover up 34% and erosion down by up to 42% since 2001. Monitoring of fire, gates and wildlife across the slopes is hard to keep current	Strength of the sustainability evidence — to confirm
Energy	312 kWp of solar on the Madeba 3 cellar covers 16% of use and saved R305,000 in year one	Lost yield unseen; next phase planned without live data
Tasting room and gallery	Open seven days. Bookings, card payments and guest Wi-Fi depend on the connection staying up	Sales lost per outage — to confirm

Sources: grahambeck.com environmental initiatives; solareff.co.za Graham Beck project; tour.wine.co.za tasting room listing (seen Oct 2026). Reserve hectares are stated as 1,885–1,978 ha across sources.

Protecting the intrinsic value of the brand starts with knowing what is happening in the cellar, the vines and the veld — before anyone has to drive out and check.

Your own **private backbone**, on a carrier-grade link

We bring a dedicated carrier-grade link to the cellar and tasting-room cluster at Madeba. From there we build Graham Beck's own private network across the estate: one backbone for the cellars, irrigation, the reserve, solar and guests. It is **owned by you and supported by us under SLA**.

Stock you can see, any hour

Cellar temperature, humidity, power and access alarms, plus CCTV. The cellar team and management see them wherever they are.

Water you can prove

Pump, flow and soil-moisture readings from the 400 ha report live. The per-hectare budget and recycled volumes are on record, not assembled later.

A reserve with current evidence

Cameras, gate and fire-watch points across the slopes, with relays on high ground where terrain needs them. It keeps the WWF story live for your export markets.

Owned, not rented

One network for every building and field system replaces separate services. It is Graham Beck's asset, monitored and maintained by CTTX under SLA.

Proof that fits: Sandy Mountain, a 33,000 ha private reserve

We took the reserve from a 3/8 Mbps consumer service to 100 Mbps symmetrical carrier backhaul and an 800+ Mbps backbone across the property. Off-grid solar relays carry battery telemetry, and call-outs dropped to zero.

Next **step**

- 1 A 20-minute conversation** — with you or the colleague you nominate, about what matters most at Madeba and what is in place today.
- 2 A desktop terrain and line-of-sight review of Madeba** — before a vehicle moves. It is the first step in designing your network, and we share the findings with you.
