

The crop is shrinking. Your irrigation is why yours needn't.

Read from your own public record — not inside knowledge. You grow, process and export organic, carbon-verified rooibos direct to tea brands, and you hold volume in dry years with solar-powered drip irrigation. That irrigation, the tea court and the plant sit **about 60 km past Clanwilliam, beyond mobile signal**, so seeing them still means being there.

What we see in your operation

WHERE	WHAT HAPPENS TODAY	WHAT IT COSTS
Solar pumps and drip lines	Spread across mountain blocks; status most likely checked by driving out	Water lost on irrigated blocks for every day a fault goes unseen in a dry spell — to confirm
Cutting, fermenting, sun-drying	Each batch done in under 24 hours on the tea court; judged on site	A stopped cutter or a missed weather call costs quality on that day's harvest — to confirm
FSSC 22000, organic, RA/UEBT, PPECB	Batch records, COAs and Rainforest Alliance platform entries must leave the farm on time	A late document or audit query holds up a 9 t or 18 t container — to confirm
Staff village	Workers and families live on the farm, far from town and mobile signal	Welfare and retention, and evidence for social certification

Irrigation run by exception, records that leave the farm the day they are made, and a farm you can see from wherever you are.

Your own **private backbone**, on a carrier-grade link

A dedicated carrier-grade link brought to your processing yard, then a network you own reaching the pump stations, dams, tea court and staff village on solar-powered relays, as the rest of the farm already runs. One backbone for irrigation telemetry, plant records, cameras, voice and staff Wi-Fi, supported by CTTX under SLA. Built in phases, starting where it pays first.

Irrigation you can see

Pump, solar, level and pressure readings with alarms, so a fault is found in hours, not on the next drive-out. This is the volume that keeps your buyers supplied in a dry year.

Records that keep up with the tea

Batch, pasteurising and dispatch records flow from the plant to your office and buyers on a link built for it, ready for audits and the Rainforest Alliance platform.

The farm from anywhere

Live view of the yard, tea court and plant in harvest, without the drive over Pakhuis Pass, plus the metering that backs your carbon claim each year.

Owned, not rented

The network is Klipopmekaar's asset, sized for a family business and built in stages, with CTTX support under SLA rather than a monthly service per building.

Sandy Mountain — 33,000 ha, off-grid

From a consumer service at 3/8 Mbps to 100 Mbps symmetrical carrier backhaul, an 800+ Mbps backbone across the property on off-grid solar relays with battery telemetry, and call-outs down to zero.

Next step

- 1 A 20-minute conversation** — before the December harvest: where the pumps, dams, plant and village are, and what reaches them today.
- 2 A desktop terrain and line-of-sight model of your farm** — the first step in designing your own network, before anyone drives out.
