

Fresh fruit every week, from a valley that keeps **getting cut off**

Read from your own public record — not inside knowledge. Your promise to the US programme is weekly reliability, and it is carried by 23 CA rooms, river pumps across your farms and traceability from orchard to pallet. When roads and power fail, **the information that protects that promise has to keep moving.**

26,000

BINS HELD IN 23 CA ROOMS

What we see in **your operation**

WHERE	WHAT HAPPENS TODAY	WHAT IT COSTS
CA and cold store	26,000 bins in 23 rooms must be watched around the clock, including when power is disrupted, as it was in the valley in May 2026	About 1,100 bins per room on average; fruit value per room to confirm
River pump stations	Pumps along the Olifants serve farms spread across the valley; the 2023 floods damaged roads and pump stations in the area	Irrigation downtime and check trips; to confirm
Traceability to the US	US access depends on fruit from registered, black-spot-free units, preclearance and in-transit cold treatment, so data must follow every bin	Pallets held back if records lag; to confirm
Getting fruit out	In 2024 the bridge on your farm was the valley's only route out; in May 2026 packing and inspections in the area stopped for a week	A missed week in the US programme; to confirm
Systems across sites	Two packhouses on optical-sorting lines, a new Operations Systems role (2025) and an automation engineer vacancy (Sept 2026)	Systems that only work where the network reaches

"The important part is to be your reliable, high-quality, consistent citrus supplier for the complete summer season." — Boet Mouton, Aug 2024

Your own **private backbone**, on a carrier-grade link

A dedicated carrier-grade link brought to Brakfontein. From there, Mouton's own private network runs along the valley to the second packhouse, the CA and cold-store controls, the river pump stations and the farm offices. One backbone carries operations systems, packline data, alarms, cameras and voice. Mouton owns it, and CTTX supports it under SLA.

Cold chain you can see from anywhere

CA atmosphere, temperature and power alarms reach the right person immediately, from the packhouse or from off site, including when the valley is cut off.

Pumps and water across your farms

Flow, pressure and pump status from every station on one network, so a fault is found in minutes, not on the next drive past.

Traceability that keeps up

Field, packhouse and export office on one network, so the systems your operations team is building work at every site, not only at head office.

Owned, not rented

The network is your asset, built to match the carrier link and supported by CTTX under SLA. Where terrain allows, a second path out of the valley, and relay sites on solar to match your existing 550 kVA investment.

Proof that fits: Sandy Mountain, 33,000 ha

From a consumer service at 3/8 Mbps to 100 Mbps symmetrical carrier backhaul and an 800+ Mbps backbone across the property, with off-grid solar relays under battery telemetry. Call-outs went to zero.

Next **step**

- 1 A 20-minute conversation** — your sites, your systems, and where losing contact would cost you most.
- 2 A desktop terrain and line-of-sight review of your sites** — the first step in designing Mouton's own network, done before anyone drives to Citrusdal.
